Contents

1. Purpose and scope
2. The agents in this phase
    2.1 Modelling agent
3. Inputs
4. Outputs and results
5. Data model, business view
6. Vendor packages
7. Where to find each design topic
8. Review gate and items to confirm
9. Where the artifacts live

Figures

Figure 1. The objects of the module and how they relate (bold borders: in scope; thick arrows: the parent owns its children)

1. Purpose and scope

We turn the extract into one platform-independent model of the org, and we decide how to rebuild Subscription Management. This document summarises the phase; the high-level design (HLD) and low-level design (LLD) in this pack hold the design itself.

2. The agents in this phase

2.1 Modelling agent

> **What it does**
>
> Turns the extract into one platform-independent model of the org, with business-friendly names for every object and field.
>
> **What it produces**
>
> - `blueprint.json` (the model)
> - `normalise-report.md`
> - `packages.md`
> - High-level design, low-level design and 20 decision records

3. Inputs

- The Discover extract: schema, rules, flows, Apex and data counts
- Business vocabulary overrides that we agree with you

4. Outputs and results

Output	Result
Objects in the model	505
Calculated fields designed	6
Business rules designed	6
Automations designed	5
Decision records	20

5. Data model, business view

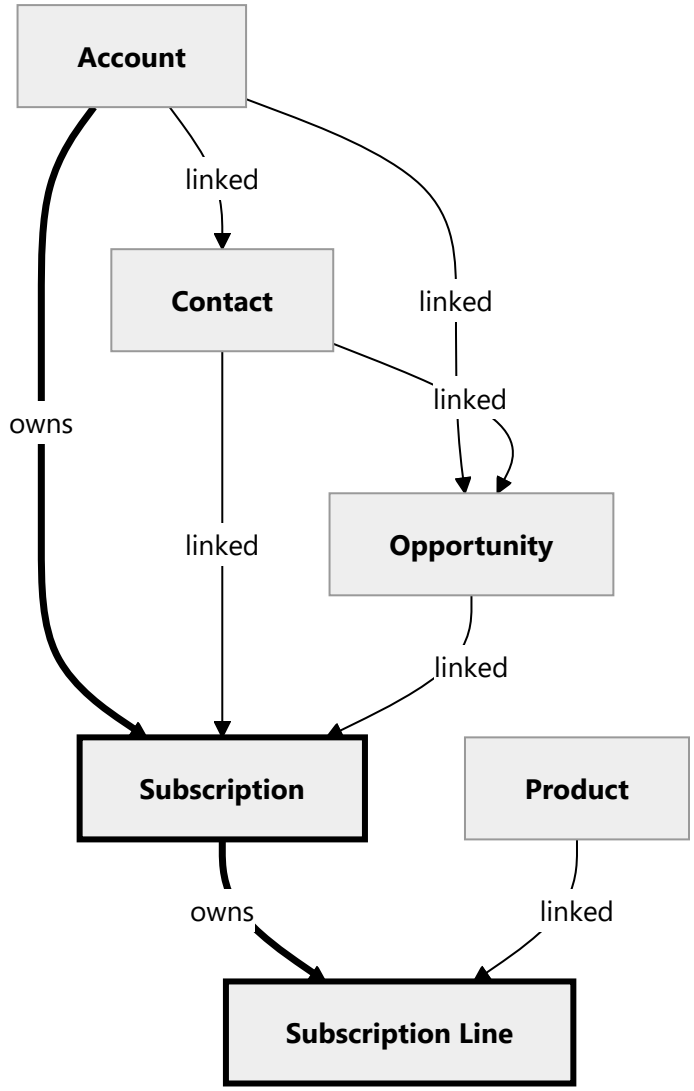

Figure 1. *The objects of the module and how they relate (bold borders: in scope; thick arrows: the parent owns its children)*

The full entity-relationship diagram, with columns and keys, is in the HLD, section 8.1.

6. Vendor packages

The vendor hides package code. We extract the settings and data, capture the behaviour as tests, then rebuild, replace or retain each package. In the demo we rebuilt DLRS from its settings: 44 of 44 values match.

Package	In use	Our proposed route
Developer Edition	no records found	not needed: installed but holds no records
Declarative Lookup Rollup Summaries Tool	yes: 2 Lookup Rollup Summary	rebuild: the behaviour is fully described by its settings and matches the package output

7. Where to find each design topic

Topic	Document and section
Scope, context and quality goals	HLD, sections 1 to 3
Target architecture on Azure: domains, services, deployment, environments, recovery	HLD, sections 5 and 7
Migration waves, system of record, adding the next module	HLD, sections 8.3 to 8.6
Business processes (lifecycle, won deal, save, alerts, renewals)	HLD, section 6
Data model, security model, data migration	HLD, section 8
Decisions and their reasons	HLD, sections 4 and 9
Fields, calculated fields and business rules	LLD, sections 1 to 3
Automations, services and access per role	LLD, sections 4 to 6
Traceability from each Salesforce element to its test	LLD, section 11

8. Review gate and items to confirm

What a person checks before the next phase starts

- The model covers every object, field, rule and automation in scope
- Each decision has a record

What we ask you to confirm

- The processes in HLD section 6 match how the business works
- The business names for objects and fields are the ones your teams use
- Which vendor packages we rebuild, replace or retain

9. Where the artifacts live

Artifact	Location
Blueprint (the model)	`adlc/2-design/modelling/blueprint/blueprint.json`
HLD, LLD and decision records	`adlc/2-design/modelling/design`
Vendor packages	`adlc/2-design/modelling/packages.md`
