7. Where the artifacts live

1. Purpose and scope

We generate the database, the business rules, the services and the access model for Subscription Management from the design. An engineer reviews every output before it merges.

2. The agents in this phase

2.1 Schema agent

> **What it does**
>
> Generates the database: tables, keys, required fields, drop-down values, formulas and roll-up totals.
>
> **What it produces**
>
> - Tables (`010_tables.sql`)
> - Calculated views (`020_views.sql`)
> - Roll-up totals (`030_rollups.sql`)

2.2 Logic agent

> **What it does**
>
> Turns validation rules into database checks, and proposes translations of custom code (Apex), drafted with a language model, for an engineer to approve.
>
> **What it produces**
>
> - Rule checks (`040_guards.sql`)
> - Translated code (`050_translations.sql`)

2.3 Security agent

> **What it does**
>
> Turns profiles, permission sets and sharing into database roles, field-level access and row-level security.
>
> **What it produces**
>
> - Roles and access (`060_security.sql`)
> - `credentials.md`

3. Inputs

- The blueprint and the design from Agent 02
- The original Apex code, for translation

4. Outputs and results

Agent	Scripts	Result	Design in
Schema	4: `000_runtime.sql`, `010_tables.sql`, `020_views.sql`, `030_rollups.sql`	6 tables, 6 calculated fields	LLD, sections 1 and 2
Logic	2: `040_guards.sql`, `050_translations.sql`	6 business rules; custom code translation in progress (1 of 6 automations started)	LLD, sections 3 and 4
Security	1: `060_security.sql`	3 profiles and permission sets become database roles	LLD, section 6

Each script names the agent that owns it and where it came from. We generate every script again on each change and compare.

5. Credentials and integrations

Salesforce never exports passwords, tokens or keys. We move users to single sign-on, matched by Federation ID. For each integration, the owner issues a new credential; we store it in Azure Key Vault, test it, and switch on an agreed date. We keep the systems that call in running through a Salesforce-compatible connection until each one moves.

Application calling in	Login type	Last login	Owner
Browser	Application	2026-10-05	to confirm
Salesforce CLI	Remote Access 2.0	2026-10-06	to confirm
orgfarm_app_1	Remote Access 2.0	2026-09-22	to confirm
Browser	Remote Access Client	2026-10-01	to confirm

6. Review gate and items to confirm

What a person checks before the next phase starts

- Each translated piece of Apex does what the original does
- Each role can do exactly what it can do in Salesforce today

What we ask you to confirm

- Who owns each integration in section 5
- The date each integration switches to its new credential

7. Where the artifacts live

Artifact	Location
Schema scripts	`adlc/3-build/schema/sql`

Artifact	Location
Logic scripts and translations	`adlc/3-build/logic/sql`
Security scripts and credentials checklist	`adlc/3-build/security`
