1. Purpose and scope
2. The agents in this phase
    2.1 Extraction agent
3. Inputs
4. Outputs and results
5. The module in the org
6. What Salesforce keeps, and how we handle it
7. Review gate and items to confirm
8. Where the artifacts live

1. Purpose and scope

We read the whole Salesforce org, read-only, and list everything in it. We also list what Salesforce does not hand over, so nothing surprises us at go-live.

2. The agents in this phase

2.1 Extraction agent

> **What it does**
>
> Reads the whole org through the Salesforce CLI and APIs: objects, fields, rules, flows, code, security, 88 kinds of configuration and every record.
>
> **What it produces**
>
> - Schema, rules and data files
> - Full metadata copy (force-app)
> - `gap-register.md`, with evidence from the org

3. Inputs

- Read-only access to the org through the Salesforce CLI, REST and Bulk APIs
- 88 kinds of configuration requested in one retrieve manifest
- Usage data: login history, scheduled jobs, report and template usage

4. Outputs and results

Area	Found
Objects described	505
Fields	9,857
Relationships	1,933
Validation rules	8
Automations (flows, triggers, jobs, routing rules)	10
Profiles and permission sets	47
Reports · dashboards · email templates	30 · 2 · 28

5. The module in the org

Object	Salesforce name	Role
Subscription	`Subscription__c`	in scope
Subscription Line	`Subscription_Line__c`	in scope
Account	`Account`	reference data the module links to
Contact	`Contact`	reference data the module links to
Opportunity	`Opportunity`	reference data the module links to
Product	`Product2`	reference data the module links to

Record counts per object are in Agent 04 - Migrate, section 4.

6. What Salesforce keeps, and how we handle it

Salesforce does not hand everything over. This register is the one place we track each item; the document in the last column holds the detail.

Item	In this org	How we handle it	Detail in
Vendor package code	2 packages	We take the settings and data, record the behaviour as tests, then rebuild, replace or retain each package	Agent 02 - Design, section 6
Passwords and secrets	never exported	Users move to single sign-on; each integration owner issues a new credential	Agent 03 - Build, section 5
Systems that call in	4 sources in login history	We keep them running through a Salesforce-compatible connection until each one moves	Agent 03 - Build, section 5
History with time limits	171 field history tables	We archive it from week one and load it with no time limit	Agent 04 - Migrate, section 6
Work in progress at go-live	0 approvals, 0 paused flows, 3 scheduled jobs	We finish each one before the freeze, or carry it over	Agent 04 - Migrate, section 7
Built-in platform behaviour	12 behaviours	We build each one into the platform once and test it in both systems	Agent 05 - Validate, section 7

7. Review gate and items to confirm

What a person checks before the next phase starts

- The inventory is complete for the module and its reference data
- Every item in section 6 has an owner and a route

What we ask you to confirm

- Which vendor packages are still in use, and who owns them
- Which other systems connect to Salesforce
- How long history must be kept for compliance

8. Where the artifacts live

Artifact	Location
Schema, rules and data	`adlc/1-discover/extraction`
Full metadata copy	`adlc/1-discover/extraction/metadata/force-app/main/default`
Inventory and gap register	`adlc/1-discover/extraction/inventory`
