7. Built-in platform behaviour
8. Still to come
9. Review gate and items to confirm
10. Where the artifacts live

Figures

Figure 1. Every check compares the two systems; a failure goes through the repair loop

1. Purpose and scope

Salesforce's own values are the expected results. We release nothing unless they match.

2. The agents in this phase

2.1 Verification agent

> **What it does**
>
> Recomputes every calculated value and compares it with what Salesforce stored, then replays the business rule cases.
>
> **What it produces**
>
> - Parity report
> - `platform-behaviour.md`

2.2 Repair agent

> **What it does**
>
> When a check fails, finds the root cause and proposes a fix to the generator, not to the output.
>
> **What it produces**
>
> - Diagnosis
> - Proposed fix (patch)

3. Inputs

- The loaded database from Agent 04
- The values Salesforce stored for every calculated field
- Test cases from the org's Apex tests, rules and security (listed in the LLD, section 10)

4. Outputs and results

Check	Result
Calculated values compared with Salesforce	866 of 866 values match
Business rule and security tests	17 pass, 0 fail, 2 pending
Test cases written for testers	19 (17 automated)

4.1 Calculated values, field by field

Field	Matched
Line Count	107 of 107
Annual Value	107 of 107
Days To Renewal	107 of 107
Total Line Value	107 of 107
Account Name	219 of 219
Line Total	219 of 219

5. How a check runs

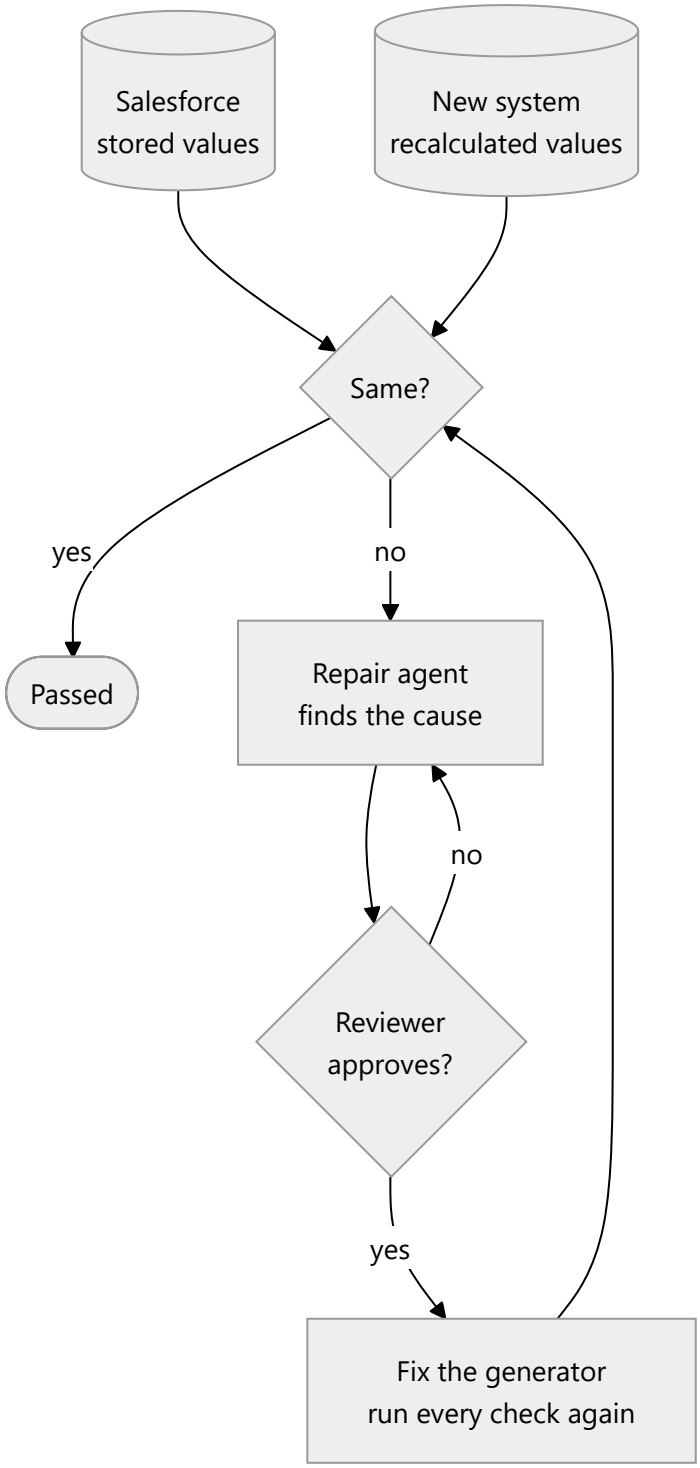

Figure 1. *Every check compares the two systems; a failure goes through the repair loop*

We apply a fix only after a reviewer approves it, then run every check again. The fix goes into the generator, never into the output.

6. What we test

Level	What it proves
Functional	Each rule and automation gives Salesforce's outcome
Data	Every record and calculated value matches
Security	Each role can do exactly what it can do today
User acceptance	Business users sign off business scenarios
Agents	The AI agents' work meets our quality bar

7. Built-in platform behaviour

These behaviours are how Salesforce itself works, so no configuration describes them. We build each one into the platform once, and test it by running the same operation in both systems.

Behaviour	How the target does it	Status
Restricted picklists reject unknown values	lookup table + foreign key	tested (`platform.restrictedPicklist`)
Master-detail delete removes the children	ON DELETE CASCADE	tested (`platform.masterDetailCascade`)
Blank numbers count as zero in formulas	COALESCE in the compiled expression	tested (formula values)
Roll-up summaries stay current	trigger-maintained column + recompute backstop	tested (roll-up values)
TODAY() in the org's time zone	app.today() evaluated in the org time zone	tested (Days_To_Renewal)
Field-level security	column grants per role	tested (`security.readOnlyFieldsNotWritable`)
Sharing inherited from the parent record	row-level security policy	tested (`security.permsetEditsAllowedFields`)
Order of execution on save	save pipeline calling generated hooks in Salesforce order, one transaction	planned
Lead conversion	service using the retrieved LeadConvertSettings field mapping	planned
Owner change moves open opportunities and cases	service rule on owner change	planned
Duplicate and matching rules	check before insert, using retrieved rule definitions	planned
Assignment and escalation rules	ordered rule engine + scheduler	planned (rules already extracted)

8. Still to come

Test	When
A won deal creates a subscription	Once the opportunity objects and the won-deal logic are rebuilt
The nightly renewal job raises tasks	Once tasks and the nightly renewal job are rebuilt

9. Review gate and items to confirm

What a person checks before the next phase starts

- Every calculated value matches, field by field
- No test fails; pending tests have a date

What we ask you to confirm

- The business scenarios for user acceptance
- Which planned platform behaviours matter most to you

10. Where the artifacts live

Artifact	Location
Test cases and parity report	`adlc/5-validate/verification`
Built-in platform behaviour	`adlc/5-validate/verification/platform-behaviour.md`
Repair proposals	`adlc/5-validate/repair`
